DEPARTMENT OF COMPUTER SCIENCE AND ENGINEERING

LAB MANUAL

Academic Year: 2015-16 ODD SEMESTER

Programme(UG/PG) : UG
Semester : V
Course Code : CS1037
Course Title : DATABASE MANAGEMENT SYSTEM LABORATORY

Prepared By

C.JAYAVARTHINI
(Assistant Professor(O.G), Department of Computer Science and Engineering)

FACULTY OF ENGINEERING AND TECHNOLOGY
SRM UNIVERSITY
(Under section 3 of UGC Act, 1956)
SRM Nagar, Kattankulathur- 603203
Kancheepuram District
LIST OF EXPERIMENTS & SCHEDULE

Course Code: CS1037

Course Title: Database Management System Laboratory

HARDWARE AND SOFTWARE REQUIREMENTS

HARDWARE REQUIREMENTS:
INTEL PENTIUM 915 GV
80GB HDD
512MB DDR

SOFTWARE REQUIREMENTS:
ORACLE 8i,9i.
MY SQL,
DB2.
# Internal Assessment Mark Split Up

- **Observation**: 20 Marks
- **Attendance**: 5 Marks
- **Mini Project with the Report**
  (Max. 8 Pages & 3 Students per Batch): 20 Marks
- **Model Exam**: 15 Marks

**TOTAL MARKS**: 60 Marks
AIM:

To create a DDL to perform creation of table, alter, modify and drop column.

DDL COMMANDS

1. The Create Table Command: - it defines each column of the table uniquely. Each column has minimum of three attributes, a name, data type and size.

   Syntax:
   
   Create table <table name> (<col1> <datatype>(<size>),<col2> <datatype><size>));
   
   Ex:create table emp(empno number(4) primary key, ename char(10));

2. Modifying the structure of tables.

   a) Add new columns

   Syntax:
   
   Alter table <tablename> add(<new col><datatype(size),<new col>datatype(size));
   
   Ex:alter table emp add(sal number(7,2));

3. Dropping a column from a table.

   Syntax:
   
   Alter table <tablename> drop column <col>;
   
   Ex:alter table emp drop column sal;

4. Modifying existing columns.

   Syntax:
   
   Alter table <tablename> modify(<col><newdatatype>(<newsize>));
   
   Ex:alter table emp modify(ename varchar2(15));
5. Renaming the tables

**Syntax:**

Rename `<oldtable>` to `<new table>`;

Ex: rename emp to emp1;

6. Truncating the tables.

**Syntax:**

Truncate table `<tablename>`;

Ex: trunc table emp1;

7. Destroying tables.

**Syntax:**

Drop table `<tablename>`;

Ex: drop table emp;
CREATION OF TABLE:

SYNTAX:
create table <tablename>(column1 datatype, column2 datatype...);

EXAMPLE:
SQL> create table std(sno number(5), sname varchar(20), age number(5), sdob date, sm1 number(4,2), sm2 number(4,2), sm3 number(4,4));
Table created.
SQL> insert into std values(101, 'AAA', 16, '03-jul-88', 80, 90, 98);
1 row created.
SQL> insert into std values(102, 'BBB', 18, '04-aug-89', 88, 98, 90);
1 row created.

OUTPUT:
Select * from std;
SNO  SNAME   AGE   SDOB      SM1   SM2   SM3
101  AAA        16       03-jul-88    80       90      98
102  BBB         18       04-aug-89  88       98      90

ALTER TABLE WITH ADD:

SQL> create table student(id number(5), name varchar(10), game varchar(20));
Table created.
SQL> insert into student values(1, 'mercy', 'cricket');
1 row created.

SYNTAX:
alter table <tablename> add (col1 datatype, col2 datatype...);

EXAMPLE:
SQL> alter table student add (age number(4));
SQL> insert into student values(2, 'sharmi', 'tennis', 19);
OUTPUT:

ALTER: select * from student;

ID NAME GAME
1 Mercy Cricket

ADD: select * from student;

ID NAME GAME AGE
1 Mercy cricket
2 Sharmi Tennis 19

ALTER TABLE WITH MODIFY:

SYNTAX:
Alter table<tablename>modify(col1 datatype,col2 datatype..);

EXAMPLE:
SQL>alter table student modify(id number(6),game varchar(25));

OUTPUT:

MODIFY
desc student;

NAME NULL? TYPE
Id Number(6)
Name Varchar(20)
Game Varchar(25)
Age Number(4)
DROP:
SYNTAX: drop table <tablename>;
EXAMPLE:
SQL> drop table student;
SQL> Table dropped.

TRUNCATE TABLE
SYNTAX: TRUNCATE TABLE <TABLE NAME>;
Example: Truncate table stud;

DESC
Example: desc emp;
Name Null? Type
--------------------------------- --------
EmpNo NOT NULL number(5)
EName VarChar(15)
Job NOT NULL Char(10)
DeptNo NOT NULL number(3)
PHONE_NO number (10)

CONSTRAINTS:
Create table tablename (column_name1 data_type constraints, column_name2 data_type constraints …)
Example:
Create table Emp (EmpNo number(5), EName VarChar(15), Job Char(10) constraint un unique, DeptNo number(3) CONSTRAINT FKey2 REFERENCES DEPT(DeptNo));
Create table stud (sname varchar2(20) not null, rollno number(10) not null,dob date not null);
DOMAIN INTEGRITY

Example: Create table cust(custid number(6) not null, name char(10));
Alter table cust modify (name not null);

CHECK CONSTRAINT

Example: Create table student (regno number (6), mark number (3) constraint b check (mark >=0 and mark <=100)); Alter table student add constraint b2 check (length(regno<=4));

ENTITY INTEGRITY

a) Unique key constraint
Example: Create table cust(custid number(6) constraint unique, name char(10)); Alter table cust add(constraint c unique(custid));

b) Primary Key Constraint
Example: Create table stud(regno number(6) constraint primary key, name char(20));

Queries:

Q1. Create a table called EMP with the following structure.
Name Type
----------------------
EMPNO NUMBER(6)
ENAME VARCHAR2(20)
JOB VARCHAR2(10)
DEPTNO NUMBER(3)
SAL NUMBER(7,2)

Allow NULL for all columns except ename and job.

Solution:
1. Understand create table syntax.
2. Use the create table syntax to create the said tables.
3. Create primary key constraint for each table as understand from logical table structure.
Ans:
SQL> create table emp(empno number(6),ename varchar2(20)not null,job varchar2(10) not null, deptno number(3),sal number(7,2));
Table created.
Q2: Add a column experience to the emp table.
experience numeric null allowed.

**Solution:**
1. Learn alter table syntax.
2. Define the new column and its data type.
3. Use the alter table syntax.
Ans: SQL> alter table emp add(experience number(2));
Table altered.

Q3: Modify the column width of the job field of emp table.

**Solution:**
1. Use the alter table syntax.
2. Modify the column width and its data type.
Ans: SQL> alter table emp modify(job varchar2(12));
Table altered.
SQL> alter table emp modify(job varchar(13));
Table altered.

Q4: Create dept table with the following structure.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEPTNO</td>
<td>NUMBER(2)</td>
</tr>
<tr>
<td>DNAME</td>
<td>VARCHAR2(10)</td>
</tr>
<tr>
<td>LOC</td>
<td>VARCHAR2(10)</td>
</tr>
</tbody>
</table>

Deptno as the primary key

**Solution:**
1. Understand create table syntax.
2. Decide the name of the table.
3. Decide the name of each column and its data type.
4. Use the create table syntax to create the said tables.
5. Create primary key constraint for each table as understand from logical table structure.
Ans:
SQL> create table dept(deptno number(2) primary key,dname varchar2(10),loc varchar2(10));
Table created.

Q5: create the emp1 table with ename and empno, add constraints to check the empno value while entering (i.e) empno > 100.

**Solution:**
1. Learn alter table syntax.
2. Define the new constraint [columns name type]
3. Use the alter table syntax for adding constraints.
Ans:
SQL> create table emp1(ename varchar2(10),empno number(6) constraint check(empno>100));
Table created.

Q6: drop a column experience to the emp table.
**Solution:**
1. Learn alter table syntax. Use the alter table syntax to drop the column.
**Ans:**
SQL> alter table emp drop column experience; Table altered.

Q7: Truncate the emp table and drop the dept table

**Solution:**
1. Learn drop, truncate table syntax.

**Ans:** SQL> truncate table emp; Table truncated.

**QUESTIONS**
1. Define DDL
2. What are constraints?
3. Categories of SQL Command.
4. Difference between truncate and drop.
5. Define primary and referential integrity.

**RESULT:**
Thus the DDL commands have been executed successfully.
AIM;

To study the various DML commands and implement them on the database.

DML COMMANDS

DML commands are the most frequently used SQL commands and is used to query and manipulate the existing database objects. Some of the commands are Insert, Select, Update, Delete.

Insert Command This is used to add one or more rows to a table. The values are separated by commas and the data types char and date are enclosed in apostrophes. The values must be entered in the same order as they are defined.

Select Commands It is used to retrieve information from the table. It is generally referred to as querying the table. We can either display all columns in a table or only specify column from the table.

Update Command It is used to alter the column values in a table. A single column may be updated or more than one column could be updated.

Delete command After inserting row in a table we can also delete them if required. The delete command consists of a from clause followed by an optional where clause.

Q1: Insert a single record into dept table.
Ans: SQL> insert into dept values (1,'IT','Tholudur');
1 row created.

Q2: Insert more than a record into emp table using a single insert command.
Ans: SQL> insert into emp values(&empno,&ename,&job,&deptno,&sal);
Enter value for empno: 1
Enter value for ename: Mathi
Enter value for job: AP
Enter value for deptno: 1
Enter value for sal: 10000
old 1: insert into emp values(&empno,&ename,&job,&deptno,&sal)
new 1: insert into emp values(1,'Mathi','AP',1,10000)
1 row created.

SQL> Enter value for empno: 2
Enter value for ename: Arjun
Enter value for job: ASP
Enter value for deptno: 2
Enter value for sal: 12000

old 1: insert into emp values(&empno,&ename,&job,&deptno,&sal)
new 1: insert into emp values(2,'Arjun','ASP',2,12000)
1 row created.

SQL> Enter value for empno: 3
Enter value for ename: Gugan
Enter value for job: ASP
Enter value for deptno: 1
Enter value for sal: 12000

old 1: insert into emp values(&empno,&ename,&job,&deptno,&sal)
new 1: insert into emp values(3,'Gugan','ASP',1,12000)
1 row created.

Q3: Update the emp table to set the salary of all employees to Rs15000/- who are working as ASP
Ans: SQL> select * from emp;

EMPNO ENAME JOB DEPTNO SAL
---------- ------------------ ------------- ---------- ----------
1 Mathi AP 1 10000
2 Arjun ASP 2 12000
3 Gugan ASP 1 12000
SQL> update emp set sal=15000 where job='ASP'; 2 rows updated.

SQL> select * from emp;

EMPNO ENAME JOB DEPTNO SAL
---------- -------------------- ------------- ---------- ----------
1 Mathi AP 1 10000
2 Arjun ASP 2 15000
3 Gugan ASP 1 15000

Q4: Create a pseudo table employee with the same structure as the table emp and insert rows into the table using select clauses.

Ans: SQL> create table employee as select * from emp;
Table created.

SQL> desc employee;

Name Null? Type
----------------------------------------- -------- ----------------------------
EMPNO NUMBER(6)
ENAME NOT NULL VARCHAR2(20)
JOB NOT NULL VARCHAR2(13)
DEPTNO NUMBER(3)
SAL NUMBER(7,2)

Q5: select employee name, job from the emp table

Ans: SQL> select ename, job from emp;
ENAME JOB
-------------------- -------------
Mathi AP
Arjun ASP
Gugan ASP
Karthik Prof
Akalya AP
suresh lect
6 rows selected.
Q6: Delete only those who are working as lecturer
Ans: SQL> select * from emp;
EMPNO ENAME JOB DEPTNO SAL
---------- -------------------- ------------- ---------- ----------
1 Mathi AP 1 10000
2 Arjun ASP 2 15000
3 Gugan ASP 1 15000
4 Karthik Prof 2 30000
5 Akalya AP 1 10000
6 suresh lect 1 8000
6 rows selected.
SQL> delete from emp where job='lect';
1 row deleted.
SQL> select * from emp;
EMPNO ENAME JOB DEPTNO SAL
---------- -------------------- ------------- ---------- ----------
1 Mathi AP 1 10000
2 Arjun ASP 2 15000
3 Gugan ASP 1 15000
4 Karthik Prof 2 30000
5 Akalya AP 1 10000

Q7: List the records in the emp table orderby salary in ascending order.
Ans: SQL> select * from emp order by sal;
EMPNO ENAME JOB DEPTNO SAL
---------- -------------------- ------------- ---------- ----------
1 Mathi AP 1 10000
5 Akalya AP 1 10000
2 Arjun ASP 2 15000
3 Gugan ASP 1 15000
4 Karthik Prof 2 30000

Q8: List the records in the emp table orderby salary in descending order.
Ans: SQL> select * from emp order by sal desc;
EMPNO ENAME JOB DEPTNO SAL
---------- -------------------- ------------- ---------- ----------
4 Karthik Prof 2 30000
2 Arjun ASP 2 15000
3 Gugan ASP 1 15000
1 Mathi AP 1 10000
5 Akalya AP 1 10000
Q9: Display only those employees whose deptno is 30.
Solution: Use SELECT FROM WHERE syntax.

Ans: SQL> select * from emp where deptno=1;
EMPNO ENAME JOB DEPTNO SAL
---------- -------------------- ------------- ---------- ----------
1 Mathi AP 1 10000
3 Gugan ASP 1 15000
5 Akalya AP 1 10000

Q10: Display deptno from the table employee avoiding the duplicated values.
Solution:
1. Use SELECT FROM syntax.
2. Select should include distinct clause for the deptno.
Ans: SQL> select distinct deptno from emp;
DEPTNO
--------
1

2
IMPLEMENTATION OF DATA AND BUILT IN FUNCTIONS IN SQL

CHARACTER/STRING FUNCTION:

SQL> select upper('welcome') from dual;

-----------
WELCOME

SQL> select upper('hai') from dual;

---
HAI

SQL> select lower('HAI') from dual;

LOW

---
hai

SQL> select initcap('hello world') from dual;

INITCAP('Hello
--------------
Hello World

SQL> select ltrim('    hai') from dual;

LTR
---
hai

SQL> select rtrim('hai     ') from dual;

RTR
---
hai

SQL> select rtrim(' hai ') from dual;
RTRIM('}
------
hai

SQL> select concat('SRM', ' university') from dual;
------------------------
SRM university

SQL> select length('SRM') from dual;
LENGTH('SRM')
----------------------
12

SQL> select replace('SRM university', 'SRM', 'Anna') from dual;
----------------
Anna university

SQL> select substr('SRM', 7, 6) from dual;
SUBSTR
------
lingam
SQL> select rpad('hai',3,'*')from dual;
RPAD(''
-----
hai***

SQL> select lpad('hai',3,'*')from dual;
LPAD(''
-----
***hai

SQL> select replace('Dany','y','ie')from dual;
REPLACE
-----
Danie

SQL> select translate('cold','ld','ol')from dual;
TRANSL
-----
cool
DATE & TIME FUNCTION

SQL> select sysdate from dual;
SYSDATE
---------
07-APR-10

SQL> select round(sysdate) from dual;
ROUND(SYS
---------
07-APR-10

SQL> select add_months(sysdate,3) from dual;
ADD_MONTH
---------
07-JUL-10

SQL> select last_day(sysdate) from dual;
LAST_DAY(
---------
30-APR-10

SQL> select sysdate+20 from dual;
SYSDATE+2
---------
27-APR-10

SQL> select next_day(sysdate,'tuesday') from dual;
NEXT_DAY(
---------
13-APR-10
NUMERIC FUNCTION

SQL> select round(15.6789) from dual;
ROUND(15.6789)
------------
16

SQL> select ceil(23.20) from dual;
CEIL(23.20)
----------
24

SQL> select floor(34.56) from dual;
FLOOR(34.56)

NESTED QUERIES AND JOIN QUERIES

Q1: Display all employee names and salary whose salary is greater than minimum salary of the company and job title starts with ‘M’.

**Solution:**

1. Use select from clause.
2. Use like operator to match job and in select clause to get the result.

Ans: SQL> select ename, sal from emp where sal>(select min(sal) from emp where job like 'A%');

<table>
<thead>
<tr>
<th>ENAME</th>
<th>SAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arjun</td>
<td>12000</td>
</tr>
<tr>
<td>Gugan</td>
<td>20000</td>
</tr>
<tr>
<td>Karthik</td>
<td>15000</td>
</tr>
</tbody>
</table>

Q2: Issue a query to find all the employees who work in the same job as Arjun.

Ans: SQL> select * from emp;

<table>
<thead>
<tr>
<th>EMPNO</th>
<th>ENAME</th>
<th>JOB</th>
<th>DEPTNO</th>
<th>SAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Mathi</td>
<td>AP</td>
<td>1</td>
<td>10000</td>
</tr>
<tr>
<td>2</td>
<td>Arjun</td>
<td>ASP</td>
<td>2</td>
<td>12000</td>
</tr>
<tr>
<td>3</td>
<td>Gugan</td>
<td>ASP</td>
<td>2</td>
<td>20000</td>
</tr>
<tr>
<td>4</td>
<td>Karthik</td>
<td>AP</td>
<td>1</td>
<td>15000</td>
</tr>
</tbody>
</table>

SQL> select ename from emp where job=(select job from emp where ename='Arjun');

<table>
<thead>
<tr>
<th>ENAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arjun</td>
</tr>
<tr>
<td>Gugan</td>
</tr>
</tbody>
</table>
SET OPERATORS

QUERIES:

Q1: Display all the dept numbers available with the dept and emp tables avoiding duplicates.

Solution:
1. Use select from clause.
2. Use union select clause to get the result.

Ans: SQL> select deptno from emp union select deptno from dept;

DEPTNO
----------
1
2
12
30
40

Q2: Display all the dept numbers available with the dept and emp tables.

Solution:
1. Use select from clause.
2. Use union all in select clause to get the result.

Ans: SQL> select deptno from emp union all select deptno from dept;

DEPTNO
-------
1
2
12
30
40
Q3: Display all the dept numbers available in emp and not in dept tables and vice versa.

**Solution:**
1. Use select from clause.
2. Use minus in select clause to get the result.

Ans: SQL> select deptno from emp minus select deptno from dept;

<table>
<thead>
<tr>
<th>DEPTNO</th>
</tr>
</thead>
<tbody>
<tr>
<td>12</td>
</tr>
</tbody>
</table>

SQL> select deptno from dept minus select deptno from emp;

<table>
<thead>
<tr>
<th>DEPTNO</th>
</tr>
</thead>
<tbody>
<tr>
<td>30</td>
</tr>
<tr>
<td>40</td>
</tr>
</tbody>
</table>

**VIEWS**

Q1: The organization wants to display only the details of the employees those who are ASP.

**Solution:**
1. Create a view on emp table named managers
2. Use select from clause to do horizontal portioning

Ans: SQL> create view empview as select * from emp where job='ASP';

View created.
SQL> select * from empview;
EMPNO ENAME JOB DEPTNO SAL
---------- -------------------- ---------- ---------- ----------
2 Arjun ASP 2 12000 3 Gugan ASP 2 20000

Q2: The organization wants to display only the details like empno, empname, deptno, deptname of the employees. (Vertical portioning)

**Solution:** 1. Create a view on emp table named general
2. Use select from clause to do vertical partitioning
   Ans: SQL> create view empview1 as select ename,sal from emp;
   View created.

Q3: Display all the views generated.
   Ans: SQL> select * from tab;
   TNAME TABTYPE CLUSTERID
   ---------------------------------------- ------- ----------
   DEPT TABLE
   EMP TABLE
   EMPVIEW VIEW
   EMPVIEW1 VIEW

Q4: Execute the DML commands on the view created.
   Ans: SQL> select * from empview;
   EMPNO ENAME JOB DEPTNO SAL
   ---------- -------------------- ---------- ---------- ----------
   2 Arjun ASP 2 12000
   3 Gugan ASP 2 20000

Q5: Drop a view.
Ans: SQL> drop view empview1;

View dropped.

Q3: Issue a query to display information about employees who earn more than any employee in dept 1. Ans: SQL> select * from emp where sal>(select max(sal) from emp where empno=1);

<table>
<thead>
<tr>
<th>EMPNO</th>
<th>ENAME</th>
<th>JOB</th>
<th>DEPTNO</th>
<th>SAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Arjun</td>
<td>ASP</td>
<td>2</td>
<td>12000</td>
</tr>
<tr>
<td>3</td>
<td>Gugan</td>
<td>ASP</td>
<td>2</td>
<td>20000</td>
</tr>
<tr>
<td>4</td>
<td>Karthik</td>
<td>AP</td>
<td>1</td>
<td>15000</td>
</tr>
</tbody>
</table>

JOINS Tables used
SQL> select * from emp;

<table>

EQUI-JOIN

Q4: Display the employee details, departments that the departments are same in both the emp and dept. Solution: 1. Use select from clause. 2. Use equi join in select clause to get the result.
Ans: SQL> select * from emp,dept where emp.deptno=dept.deptno;

<table>
<thead>
<tr>
<th>EMPNO</th>
<th>ENAME</th>
<th>JOB</th>
<th>DEPTNO</th>
<th>SAL</th>
<th>DEPTNO</th>
<th>DNAME</th>
<th>LOC</th>
</tr>

</tr>
</tbody>
</table>

NON-EQUIJOIN
Q5: Display the employee details, departments that the departments are not same in both the emp and dept. Solution: 1. Use select from clause. 2. Use non equi join in select clause to get the result.

Ans: SQL> select * from emp,dept where emp.deptno!=dept.deptno;
EMPNO ENAME JOB DEPTNO SAL DEPTNO DNAME LOC

**DCL COMMANDS**

The DCL language is used for controlling the access to the table and hence securing the database. DCL is used to provide certain privileges to a particular user. Privileges are rights to be allocated. The privilege commands are namely, Grant and Revoke. The various privileges that can be granted or revoked are, Select Insert Delete Update References Execute All.

**GRANT COMMAND:** It is used to create users and grant access to the database. It requires database administrator (DBA) privilege, except that a user can change their password. A user can grant access to their database objects to other users.

**REVOKE COMMAND:** Using this command, the DBA can revoke the granted database privileges from the user.

**TCL COMMAND**

**COMMIT** command is used to save the Records.

**ROLL BACK** command is used to undo the Records.

**SAVE POINT** command is used to undo the Records in a particular transaction.

**Queries:**

Tables Used: Consider the following tables namely “DEPARTMENTS” and “EMPLOYEES”

Their schemas are as follows, Departments (dept_no, dept_name, dept_location);
Employee (emp_id, emp_name, emp_salary);

Q1: Develop a query to grant all privileges of employees table into departments table

Ans: SQL> Grant all on employees to departments;
Grant succeeded.

Q2: Develop a query to grant some privileges of employees table into departments table

Ans: SQL> Grant select, update, insert on departments to departments with grant option;
Grant succeeded.

Q3: Develop a query to revoke all privileges of employees table from departments table

Ans: SQL> Revoke all on employees from departments; Revoke succeeded.

Q4: Develop a query to revoke some privileges of employees table from departments table

Ans: SQL> Revoke select, update, insert on departments from departments;
Revoke succeeded.
Q5: Write a query to implement the save point

Ans: SQL> SAVEPOINT S1;
Savepoint created.

SQL> select * from emp;

EMPNO ENAME JOB DEPTNO SAL
---------- -------------------- ------------- ---------- ----------
1 Mathi AP 1 10000
2 Arjun ASP 2 15000
3 Gugan ASP 1 15000
4 Karthik Prof 2 30000

SQL> INSERT INTO EMP VALUES(5,'Akalya','AP',1,10000); 1 row created.

SQL> select * from emp;

EMPNO ENAME JOB DEPTNO SAL
---------- -------------------- ------------- ---------- ----------
1 Mathi AP 1 10000
2 Arjun ASP 2 15000
3 Gugan ASP 1 15000
4 Karthik Prof 2 30000
5 Akalya AP 1 10000

Q6: Write a query to implement the rollback

Ans: SQL> rollback s1; SQL> select * from emp;

EMPNO ENAME JOB DEPTNO SAL
---------- -------------------- ------------- ---------- ----------
1 Mathi AP 1 10000
2 Arjun ASP 2 15000
3 Gugan ASP 1 15000
4 Karthik Prof 2 30000

Q6: Write a query to implement the commit

Ans: SQL> COMMIT;

Commit complete.

RESULT

Thus the DML, DCL,TCL commands was performed successfully and executed.

EX NO:7  Database design using E-R model and Normalization

ER diagram:

Chen Notation

- **ORDER** (OrderNum (key), OrderDate, SalesPerson)
- **ORDERITEMS** (OrderNum (key)(fk), ItemNum (key), PartNum, Quantity, Cost)
- In the above example, in the ORDERITEMS Relation: OrderNum is the *Foreign Key* and OrderNum plus ItemNum is the *Composite Key*.

Chen Notation

- **CUSTOMER** (CustomerID (key), Name, Address, ...)
- **ORDER** (OrderNum (key), OrderDate, SalesPerson, CustomerID (fk))

Representing Relationships

- **1:1** Relationships. The key of one relation is stored in the second relation. Look at example queries to determine which key is queried most often.
- **1:N** Relationships.
  - **Parent** - Relation on the "1" side.
  - **Child** - Relation on the "Many" side.
- Represent each Entity as a relation. Copy the key of the parent into the child relation.
- **M:N Relationships.** Many to Many relationships can not be directly implemented in relations.
  - Solution: Introduce a third *Intersection relation* and copy keys from original two relations.

### Chen Notation

- **Supplier**
  - `SupplierID` (id)
  - FirmName
  - Address
  - ...

- **Component**
  - `CompID` (id)
  - Description
  - ...

- **SUPPLIER** *(SupplierID (key), FirmName, Address, ...)*
- **COMPONENT** *(CompID (key), Description, ...)*
- **SUPPLIER_COMPONENT** *(SupplierID (key), CompID (key))*

- Note that this can also be shown in the ER diagram. Also, look for potential added attributes in the intersection relation.

### RESULT:

Thus the ER Database design using E-R model and Normalization was implemented successfully.
STEPS:

1. Create a database for payroll processing which request the using SQL.
2. Establish ODBC connection.
3. In the administrator tools open data source ODBC.
4. Click add button and select oracle in ORA home 90, click finish.
5. A window will appear given the data source home as oracle and select TNS source name as lion and give the used id as SWTT.
6. ADODC CONTROL FOR SALARY FORM:-
7. The above procedure must be follow except the table, A select the table as salary.
8. Write appropriate Program in form each from created in VB from each from created in VB form project.

SQL> create table emp(eno number primary key, enamr varchar(20),age number, addr varchar(20),DOB date, phno number(10));
Table created.

SQL> create table salary(eno number, edesig varchar(10), basic number, da number, hra number, pf number, mc number, met number, foreign key(eno) references emp);
Table created.

Output:
RESULT:
Thus payroll system was designed and implemented successfully.
DETAILS OF THE STEP
1. Create the DB for banking system source request the using SQL
2. Establishing ODBC connection
3. Click add button and select oracle in ORA home 90 click finished
4. A window will appear give the data source name as oracle and give the user id as scott
5. Now click the test connection a window will appear with server and user name give user as scott and password tiger Click ok
6. VISUAL BASIC APPLICATION:-
   □ Create standard exe project in to and design ms from in request format
   □ To add ADODC project select component and check ms ADO data control click ok
   □ Now the control is added in the tool book
   □ Create standard exe project in to and design ms from in request format
7. ADODC CONTEOL FOR ACCOUNT FROM:- Click customs and property window and window will appear and select ODBC data source name as oracle and click apply as the some window.

CREATE A TABLE IN ORACLE

SQL> create table account(cname varchar(20),accno number(10),balance number);
Table Created
SQL> insert into account values('&cname',&accno,&balance);
Enter value for cname: Mathi
Enter value for accno: 1234
Enter value for balance: 10000
old 1: insert into account values('&cname',&accno,&balance)
new 1: insert into emp values('Mathi',1234,10000) 1 row created.

EX NO:10 DESIGN AND IMPLEMENTATION OF STUDENT MANAGEMENT SYSTEM

STEPS:

1. Create a database for library which request the using SQL
2. Establish ODBC connection
3. In the administrator tools open data source ODBC
4. Click add button and select oracle in ORA home 90, click finish
5. A window will appear given the data source home as oracle and select TNS source name as lion and give the used id as SWTT
6. ADODC CONTROL FOR library FORM:-
7. The above procedure must be follow except the table , A select the table as library
8. Write appropriate Program in form each from created in VB from each from created in VB form project.
   i. ADMINISTRATOR Table
   This table holds the profile information of the application super users otherwise known as system
   administrators. They have control of the software meaning that they can perform additional tasks that
   other users cannot ordinarily perform. Every software of this nature has such users and this one is no
   exception. The table contains the following columns; ADMIN_ID, TITLE, FRIST_NAME, LAST_NAME, and DEPARMENT_ID. The column ADMIN_ID is the primary key column
   (primary key disallows duplicate values and nulls in a column) every table should have a primary key column,
   as this acts like table indexing.
ii. ALL_COURSES Table

This table keeps the courses offered by students in different departments in the school. The table contains the following columns; COURSE_ID, COURSE_TITLE, and COURSE_CODE. The COURSE_ID is the primary key column.

iii. APP_USER_A Table

This table contains application login details for application administrators. The table columns are;

USRNAME, PASSWD and ADMIN_ID. The column ADMIN_ID is the primary key column.

iv. APP_USER_L Table

This table contains application login details for application lecturers. The table columns are;

USRNAME, PASSWD and LECTURER_ID. The column LECTURER_ID is the primary key column.

v. APP_USER_S Table

This table contains application login details for application students. The table columns are;

USRNAME, PASSWD and MATRIG_NO. The column MATRIG_NO is the primary key column.

vi. DEPARTMENTS Table

This table holds information about the schools departments. The table contains the following columns;

DEPARTMENT_ID and DEPARTMENT_NAME. The column DEPARTMENT_ID is the primary key column.

vii. GRADES Table

This is more like the main table in the database as all other tables relate to this table directly or in some other way. This table holds students examination records. The table contains the following
columns; GRADES_ID, SESSION1, REG_NUMBER, DEPARTMENT_ID, LEVEL1, MATRIG_NO, FRIST_NAME, LAST_NAME, COURSE_CODE, GRADE, CREDIT_UNIT, SCORE, LECTURER_ID and GRADE_POINT. The column GRADES_ID is the primary key column.

viii. LECTURERS Table

This table holds the profile information of the application lecturers. The table contains the following columns; LECTURER_ID, TITLE, FRIST_NAME, LAST_NAME, and DEPARTMENT_ID. The column LECTURER_ID is the primary key column.

ix. REG_TABLE Table

This table contains student’s registration details i.e. if a student is registered for the semester this table is used to store that information. The table contains the following columns; REG_ID, REG_NUMBER, MATRIG_NO, FRIST_NAME, LAST_NAME, LEVEL1, DEPARTMENT_ID and SESSION1. The column REG_ID is the primary key column.

x. STUDENTS Table

This table holds the profile information of the application students. The table contains the following columns; MATRIG_NO, TITLE, FRIST_NAME, LAST_NAME, and DEPARTMENT_ID. The column MATRIG_NO is the primary key column.

RESULT:

Thus the student information system was designed and implemented successfully.
AIM:

To study about automatic backup of files and recovery.

INTRODUCTION:

Because data is the heart of the enterprise, it's crucial to protect it. And to protect organization's data, one need to implement a data backup and recovery plan. Backing up files can protect against accidental loss of user data, database corruption, hardware failures, and even natural disasters. It's our job as an administrator to make sure that backups are performed and that backup tapes are stored in a secure location.

Creating a Backup and Recovery Plan

Data backup is an insurance plan. Important files are accidentally deleted all the time. Mission-critical data can become corrupt. Natural disasters can leave office in ruin. With a solid backup and recovery plan, one can recover from any of these.

Figuring Out a Backup Plan

It takes time to create and implement a backup and recovery plan. We'll need to figure out what data needs to be backed up, how often the data should be backed up, and more. To help we create a plan, consider the following:

- How important is the data on systems? The importance of data can go a long way in helping to determine if one need to back it up—as well as when and how it should be backed up. For critical data, such as a database, one'll want to have redundant backup sets that extend back for several backup periods. For less important data, such as daily user files, we won't need such an elaborate backup plan, but 'll need to back up the data regularly and ensure that the data can be recovered easily.

- What type of information does the data contain? Data that doesn't seem important to we may be very important to someone else. Thus, the type of information the data contains can help we determine if we need to back up the data—as well as when and how the data should be backed up.

- How often does the data change? The frequency of change can affect our decision on how often the data should be backed up. For example, data that changes daily should be backed up daily.

- How quickly do we need to recover the data? Time is an important factor in creating a backup plan. For critical systems, we may need to get back online swiftly. To do this, we may need to alter our backup plan.

- Do we have the equipment to perform backups? We must have backup hardware to perform backups. To perform timely backups, we may need several backup devices and
several sets of backup media. Backup hardware includes tape drives, optical drives, and removable disk drives. Generally, tape drives are less expensive but slower than other types of drives.

- Who will be responsible for the backup and recovery plan? Ideally, someone should be a primary contact for the organization's backup and recovery plan. This person may also be responsible for performing the actual backup and recovery of data.
- What is the best time to schedule backups? Scheduling backups when system use is as low as possible will speed the backup process. However, we can't always schedule backups for off-peak hours. So we'll need to carefully plan when key system data is backed up.
- Do we need to store backups off-site? Storing copies of backup tapes off-site is essential to recovering our systems in the case of a natural disaster. In our off-site storage location, we should also include copies of the software we may need to install to reestablish operational systems.

The Basic Types of Backup

There are many techniques for backing up files. The techniques use will depend on the type of data we're backing up, how convenient we want the recovery process to be, and more.

If we view the properties of a file or directory in Windows Explorer, we'll note an attribute called Archive. This attribute often is used to determine whether a file or directory should be backed up. If the attribute is on, the file or directory may need to be backed up. The basic types of backups we can perform include

- Normal/full backups All files that have been selected are backed up, regardless of the setting of the archive attribute. When a file is backed up, the archive attribute is cleared. If the file is later modified, this attribute is set, which indicates that the file needs to be backed up.
- Copy backups All files that have been selected are backed up, regardless of the setting of the archive attribute. Unlike a normal backup, the archive attribute on files isn't modified. This allows us to perform other types of backups on the files at a later date.
- Differential backups Designed to create backup copies of files that have changed since the last normal backup. The presence of the archive attribute indicates that the file has been modified and only files with this attribute are backed up. However, the archive attribute on files isn't modified. This allows to perform other types of backups on the files at a later date.
- Incremental backups Designed to create backups of files that have changed since the most recent normal or incremental backup. The presence of the archive attribute indicates that the file has been modified and only files with this attribute are backed up. When a file is backed up, the archive attribute is cleared. If the file is later modified, this attribute is set, which indicates that the file needs to be backed up.
- Daily backups Designed to back up files using the modification date on the file itself. If a file has been modified on the same day as the backup, the file will be backed up. This technique doesn't change the archive attributes of files.
In we backup plan we'll probably want to perform full backups on a weekly basis and supplement this with daily, differential, or incremental backups. We may also want to create an extended backup set for monthly and quarterly backups that includes additional files that aren't being backed up regularly.

Tip We'll often find that weeks or months can go by before anyone notices that a file or data source is missing. This doesn't mean the file isn't important. Although some types of data aren't used often, they're still needed. So don't forget that we may also want to create extra sets of backups for monthly or quarterly periods, or both, to ensure that we can recover historical data over time.

Differential and Incremental Backups

The difference between differential and incremental backups is extremely important. To understand the distinction between them. As it shows, with differential backups we back up all the files that have changed since the last full backup (which means that the size of the differential backup grows over time). With incremental backups, we only back up files that have changed since the most recent full or incremental backup (which means the size of the incremental backup is usually much smaller than a full backup).

Once we determine what data we're going to back up and how often, we can select backup devices and media that support these choices. These are covered in the next section.

Selecting Backup Devices and Media

Many tools are available for backing up data. Some are fast and expensive. Others are slow but very reliable. The backup solution that's right for our organization depends on many factors, including

- **Capacity** The amount of data that we need to back up on a routine basis. Can the backup hardware support the required load given our time and resource constraints?
- **Reliability** The reliability of the backup hardware and media. Can we afford to sacrifice reliability to meet budget or time needs?
- **Extensibility** The extensibility of the backup solution. Will this solution meet our needs as the organization grows?
- **Speed** The speed with which data can be backed up and recovered. Can we afford to sacrifice speed to reduce costs?
- **Cost** The cost of the backup solution. Does it fit into our budget?

**Common Backup Solutions**

Capacity, reliability, extensibility, speed, and cost are the issues driving our backup plan. If we understand how these issues affect our organization, we'll be on track to select an appropriate backup solution. Some of the most commonly used backup solutions include
• Tape drives: Tape drives are the most common backup devices. Tape drives use magnetic tape cartridges to store data. Magnetic tapes are relatively inexpensive but aren't highly reliable. Tapes can break or stretch. They can also lose information over time. The average capacity of tape cartridges ranges from 100 MB to 2 GB. Compared with other backup solutions, tape drives are fairly slow. Still, the selling point is the low cost.

• Digital audio tape (DAT) drives: DAT drives are quickly replacing standard tape drives as the preferred backup devices. DAT drives use 4 mm and 8 mm tapes to store data. DAT drives and tapes are more expensive than standard tape drives and tapes, but they offer more speed and capacity. DAT drives that use 4 mm tapes can typically record over 30 MB per minute and have capacities of up to 16 GB. DAT drives that use 8 mm tapes can typically record more than 10 MB per minute and have capacities of up to 36 GB (with compression).

• Auto-loader tape systems: Auto-loader tape systems use a magazine of tapes to create extended backup volumes capable of meeting the high-capacity needs of the enterprise. With an auto-loader system, tapes within the magazine are automatically changed as needed during the backup or recovery process. Most auto-loader tape systems use DAT tapes. The typical system uses magazines with between 4 and 12 tapes. The main drawback to these systems is the high cost.

• Magnetic optical drives: Magnetic optical drives combine magnetic tape technology with optical lasers to create a more reliable backup solution than DAT. Magnetic optical drives use 3.5-inch and 5.25-inch disks that look similar to floppies but are much thicker. Typically, magnetic optical disks have capacities of between 1 GB and 4 GB.

• Tape jukeboxes: Tape jukeboxes are similar to auto-loader tape systems. Jukeboxes use magnetic optical disks rather than DAT tapes to offer high-capacity solutions. These systems load and unload disks stored internally for backup and recovery operations. Their key drawback is the high cost.

• Removable disks: Removable disks, such as Iomega Jaz, are increasingly being used as backup devices. Removable disks offer good speed and ease of use for a single drive or single system backup. However, the disk drives and the removable disks tend to be more expensive than standard tape or DAT drive solutions.

• Disk drives: Disk drives provide the fastest way to back up and restore files. With disk drives, you can often accomplish in minutes what takes a tape drive hours. So when business needs mandate a speedy recovery, nothing beats a disk drive. The drawbacks to disk drives, however, are relatively high costs and less extensibility.

Before we can use a backup device, we must install it. When we install backup devices other than standard tape and DAT drives, we need to tell the operating system about the controller card and drivers that the backup device uses. For detailed information on installing devices and drivers, see the section of Chapter 2 entitled "Managing Hardware Devices and Drivers."
Buying and Using Tapes

Selecting a backup device is an important step toward implementing a backup and recovery plan. But we also need to purchase the tapes or disks, or both, that will allow us to implement our plan. The number of tapes we need depends on how much data we'll be backing up, how often we'll be backing up the data, and how long we'll need to keep additional data sets.

The typical way to use backup tapes is to set up a rotation schedule whereby we rotate through two or more sets of tapes. The idea is that we can increase tape longevity by reducing tape usage and at the same time reduce the number of tapes we need to ensure that we have historic data on hand when necessary.

One of the most common tape rotation schedules is the 10-tape rotation. With this rotation schedule, we use 10 tapes divided into two sets of 5 (one for each weekday). As shown in Table 14-2, the first set of tapes is used one week and the second set of tapes is used the next week. On Fridays, full backups are scheduled. On Mondays through Thursdays, incremental backups are scheduled. If we add a third set of tapes, we can rotate one of the tape sets to an off-site storage location on a weekly basis.

Tip The 10-tape rotation schedule is designed for the 9 to 5 workers of the world. If we're in a 24 x 7 environment, we'll definitely want extra tapes for Saturday and Sunday. In this case, use a 14-tape rotation with two sets of 7 tapes. On Sundays, schedule full backups. On Mondays through Saturdays, schedule incremental backups.

RESULT:
Thus the study of automatic backup of files was performed successfully.
EXERCISE NO-1(a) INSERTION SORT

AIM: To arrange the numbers in ascending order using insertion sort.

Algorithm:

1) Repeat step 2 to 5 for K=1 to n-1
2) Set temp=arr[k]
3) Set j=k-1
4) Repeat while temp <=arr[j] & & j>0
   Set arr[j+1]=arr[j]
   Set j=j-1
5) Set arr [j+1] = temp
6) Exit

Program:

```c
#include<stdio.h>
#include<conio.h>
void insertion_sort(int a[]);
void main()
{
 int arr[10],i;
 printf("Enter the elements of the array");
 for(i=0;i<10;i++)
 {
  scanf("%d",&arr[i]);
 }
 insertion_sort(arr);
 getch();
}
void insertion_sort(int a[])
{
 int k,j,temp,n;
 n=10;
 for(k=1;k<=(n-1);k++)
 {
  temp=a[k];
  j=k-1;
  while(temp<=a[j] && j>=0)
   {
    a[j+1]=a[j];
    j=j-1;
   }
  a[j+1]=temp;
 }
 printf("sorted array is:");
 for(k=0;k<10;k++)
 { printf("%d\n",a[k]);
 }
```
Output:

```
Enter the array

```

RESULT:
The elements were successfully arranged in ascending order using insertion sort
EXERCISE NO-1(b) SELECTION SORT

**AIM**: To arrange the numbers in ascending order using selection sort.

**Algorithm**:

1) Repeat step 2 and 3 for K=1 to n-1
2) Call smallest (arr,k,n,pos)
3) Swap a[k] with arr[pos]
4) Exit

*Smallest(arr,k,n,pos)*

1) Set small = arr[k]
2) Set pos=k
3) Repeat for j=k+1 to n-1
   If small>arr[j]
   Set pos=j
   [end of if]
   [end of loop]
4) Exit

**Program**:

```c
#include<stdio.h>
#include<conio.h>
int smallest(int arr[], int k, int n)
{
    int small, j, pos;
    small = arr[k];
    pos = k;
    for (j = k + 1; j < n; j++)
    {
        if (small > arr[j])
        {
            small = arr[j];
            pos = j;
        }
    }
    return pos;
}
void main()
{
    int i, arr[6], k, c, temp;
    clrscr();
    printf("Enter 6 numbers: ");
    for (i = 0; i < 6; i++)
    {
```
```c
scanf("%d",&arr[i]);
}
for(i=0;i<6;i++)
{
    c=smallest(arr,i,6);
    temp=arr[i];
    arr[i]=arr[c];
    arr[c]=temp;
}
for(i=0;i<6;i++)
{
    printf("%d ",arr[i]);
}
getch();
}
```

**Output**:

```
Enter the array?

**RESULT**:

The elements were successfully arranged in ascending order using selection sort.
EXERCISE NO-2 MERGE SORT

**AIM:** To sort the given elements using Merge sort.

**Algorithm:**

Merge_Sort(arr, beg, end)

1) If beg < end then
   
   Set mid = (beg + end)/2

Call Merge_Sort(arr, beg, mid)

Call Merge_Sort(arr, mid+1, end)

Call Merge_Sort(arr, beg, mid, end)

[end of if]

Merge (arr, beg, mid, end)

1) Initialise set i = beg; j = mid+1; index = 0
2) Repeat while (i <= mid) and (j <= end)
   
   If arr[i] < arr[j], then
   
   Set temp[index] = arr[i]
   
   Set i = i + 1
   
   else
   
   Set temp[index] = arr[j]
   
   Set j = j + 1

[End of if]

Set index = index + 1

[End of loop]

Merge (arr, beg, mid, end)

3) [Copy the remaining elements of right sub array if any]
   
   If i > mid then
   
   Repeat while j <= end

Set index = index + 1

[ end of loop]
[copy the remaining elements of left sub. Array ,if any] else
repeat while i<= mid
set temp[index]=arr[i]
set index = index + 1,sort i = i+1
[end of loop]

 Program:

#include<stdio.h>
#include<conio.h>
int arr[10];
void merge_sort(int arr[], int beg, int end);
void merge(int a[], int beg, int mid, int end);

void main()
{
int i;
clrscr();
printf("Enter the array");
for(i=0; i<10; i++)
{
scanf("%d", &arr[i]);
}
merge_sort(arr, 0, 9);
printf("array");
for(i=0; i<10; i++)
{
printf("%d", &arr[i]);
}
getch();
}
void merge_sort(int arr[], int beg, int end)
{
i=i;
if(beg<end)
{
int mid=(beg+end)/2;
merge_sort(arr, beg, mid);
merge_sort(arr, mid+1, end);
merge(arr, beg, mid, end);
}
}
void merge(int arr[], int beg, int mid, int end)
{
i=i;
j=mid+1;
index=beg;
while(i<=mid && j<=end)
{
if(arr[i]<arr[j])
{
temp[index]=arr[i];
i=i+1;
}
else
{
temp[index]=arr[j];
j=j+1;
}
index=index+1;
}
if(i>mid)
{
    while(j<=end)
    {
        temp[index]=arr[j];
        index=index+1;
        j=j+1;
    }
}
else
{
    while(i<=mid)
    {
        temp[index]=arr[i];
        index=index+1;
        i=i+1;
    }
}
for(i=beg;i<index;i++)
{
    arr[i]=temp[i];
}

EXERCISE NO-2(b) QUICK SORT

AIM: To sort the given elements using Quick sort.

Algorithm:

Quick_Sort(arr,beg,end)

1) If beg < end then
   Call partition(arr,beg,end,loc)
   Call Quick_Sort(arr,beg,mid+1)
   Call Quick_Sort(arr,loc+1,end)
[end of if]

2) end

partition (arr,beg,end,loc)

1) Initially set left = beg ;,right =end
   Loc=beg, flag = 0
2) Repeat steps 3 to 6 while flag = 0
3) Repeat while arr[loc] <= arr[right] and loc!=right
               Set right = right -1
               [End of loop]
4) If loc == right then
   Set flag = 1
   else if arr[loc] > arr[right]
   then
     swaparr[loc] with arr[right]
   setloc = right
   [END OF IF]
5) If flag = 0 then
   Repeat while arr[loc] >= arr[left]
   andloc!=left
   set loc = left + 1

[END OF LOOP]
6) If loc == left then 
    Set flag = 1
Else if arr[loc] < arr[left] then
    Swap arr[loc] with arr[left]
    Set loc = left
[END OF IF]
[END OF LOOP]

7) end

Program:

#include<stdio.h>
#include<conio.h>
int part(int a[], int beg, int end, int loc);
void quicksort(int a[], int beg, int end);
int a[10];
void main()
{int i;
 printf("enter the array");
for(i=0; i<10; i++)
{ scanf("%d", &a[i]);
}
quicksort(a, 0, 9);
printf("sorted");
for(i=0; i<10; i++)
{ printf("%d\n", a[i]);
}
getch();
}
void quicksort(int a[], int beg, int end)
{int loc = beg;
 if(beg < end)
 {if(loc == beg)
  {loc = part(a, beg, end, loc);
  }
quicksort(a, beg, loc - 1);
quicksort(a, loc + 1, end);
}
int part(int a[], int beg, int end, int loc)
{int left, temp, right, flag, i;
left = beg;
right = end;
loc = beg;
flag = 0;
while(flag == 0)
{ while((a[loc] <= a[right]) && loc != right)
{ right = right - 1;
}
if(loc == right)
{    flag=1;
}
else if(a[loc]>a[right])
{    temp= a[loc];
a[loc]=a[right];
a[right]=temp;
loc=right;
}
if(flag==0)
{    while((a[loc]>=a[left]) &&loc!=left)
{        left=left+1;
}
}
if(loc==left)
{    flag=1;
}
else if(a[loc]<a[left])
{    temp=a[loc];
a[loc]=a[left];
a[left]=temp;
loc=left;
}
} returnloc;
}

**Output:**

```

**RESULT:**

Hence the program for Sorting an array using quick sort was successfully executed.
EXERCISE NO-3        STACKS

AIM: To write a menu driven program to perform following operations on the stack-

(i) Push  (ii) Pop  (iii) Peek

Algorithm:

Push-
1) If top=MAX-1 then print “overflow”
2) Set top=top+1;
3) Set stack[top]=val;
4) end

Pop-
1) if top==NULL then print “underflow”
2) set val=stack[top]
3) set top=top-1;
4) end

Peep-
1) if top==NULL then print “empty stack”
   go to step 3
2) return stack[top];
3) end

Program:

#include<stdio.h>
#include<conio.h>
int a[5];int max=4;int top=-1;
void pop();void push();
void peek(); voiddisp();
void main()
{	int j,k;
char ch;
crslcr();
do
{	printf("n1push
2)pop
3)peek
4)Display Stack");
scanf("%d", &j);
switch(j)
{	casense 1:push();break;
case 2:pop();break;
case 3:peek();break;
case 4:disp();break;
default:printf("invalid choice");  }
printf("nDo you want to continue? (y/n)");
scanf("%s", &ch);
while(ch=='y');
getch();
void push()
{
    intval;
    if(top==max)
        printf("stack overflow\n");
    else
    {
        top++;
        printf("Enter the element");
        scanf("%d",&val);
        a[top]=val;
    }
}
void pop()
{
    intval;
    if(top==-1)
        printf("stack underflow\n");
    else
    {
        val=a[top];
        top--;
        printf("deleted element %d", val);
    }
}
void peek(int a[],int top)
{
    if(top==--)
        printf("empty stack\n");
    else
        printf("%d",a[top]);
}
void disp()
{
    printf("Elements of stack are\n");
    for(k=0;k<=top;k++)
    {
        printf("%d",a[k]);
    }
}

Output:

RESULT:

Hence the program for implementing stack operations like push, pop and peek were successfully executed.
EXPERIMENT NO. 4  LIST USING ARRAYS

**AIM**: To perform list operations with the help of arrays using C programming

**ALGORITHM**

```c
main()
1. Display the operation that can be performed
2. Repeat step 3 and 4 until x!=7
3. x← choice of user
4. switch x
   case 1: insertion(y, p)
   case 2: deletion()
   case 3: findpos()
   case 4: index(y)
   case 5: empty()
   case 6: display()
   [end switch]
   [[end do while]]

insertion(int a, int b)
1. If end>9
   print overflow
2. Else
   For I from end +1 to b
   Arr(i+1)←Arr(i)

deletion(int a, int b)
1. For I in range a to end
   Arr(i)←Arr(i+1)
2. (end for)
3. end←end+1

findpos(int a)
1. if a>=0 and a<=end
   Print Arr(a)
2. Else
   Print position doesn’t exist

Empty()
1. end← -1

EXERCISE NO-5 QUEUES

**AIM:** To perform queue operations on the menu-
(i) Insert (ii) Delete (iii) Peek (iv) Display

**Algorithm:**

**Insert:**
1) If rear=MAX-1 then print “overflow”
2) If front=-1 and rear=-1 then set front=rear=0
   Else
   Set rear=rear+1;
3) Set queue[rear]num
4) end

**Delete:**
1) if front=-1 or front>rear then print “underflow”
   else
   set front=front+1;
   setval=queue[front];
2) end
3)

**Peek:**
1) Print queue[front]
2) end

**Program:**

```c
#include<stdio.h>
#include<conio.h>
int a[5]; int rear=-1;
int front=-1; int max=5;
void delete(); void insert(); void peek();
void main()
{ int j,k;
  clrscr();
  do{
    printf("1)Insert 2)Delete 3)Peek 4)Display Queue") ;
    scanf("%d",&j) ;
    switch(j)
    { case 1: insert();break;
      case 2: delete();break;
      case 3: peek();break;
      case 4: printf("Elemnts of queue are\n");
      for(k=front;k<=rear;k++)
      { printf("\n%d",a[k]);
    }
```
void peek()
{
    printf("Peek element: %d",a[front]);
}

void insert()
{
   intval;
    printf("Enter the element");
    scanf("%d",&val);
    if(rear==max-1)
        printf("Queue overflow\n");
    if (front==-1 & & rear==-1)
        front =rear=0;
    else
        rear++;
    a[rear]=val;
}
void pop()
{
    intval;
    if(front==-1||front>rear)
        printf("Queue underflow \n");
    else
        {front++;
        val=a[front];
        printf("Element Deleted");
        }
}

Output :

1) Insert
2) Delete
3) Peek
4) Display Queue
Elements of queue are

0
Do you want to continue? (y/n)
1) Insert
2) Delete
3) Peek
4) Display Queue
Element Deleted
Do you want to continue? (y/n)
1) Insert
2) Delete
3) Peek
4) Display Queue
Queue underflow
Do you want to continue? (y/n)

RESULT :

Hence the program for queue operations was successfully executed.
EXERCISE NO-6  SINGLY LINKED LIST

AIM: To write program to create linked list and perform the following function

a) Insertion
b) Deletion
c) Searching
d) Display

Algorithm:

Insertion at beginning

1) Allocate memory for new node.
2) Set new_node\(\rightarrow\)data = val
3) Set new_node\(\rightarrow\)next = start
4) Set start = new_node
5) End.

Insertion at end

3) Set new_node\(\rightarrow\)next = null
4) Set ptr = start
5) Set step 6 while
   Ptr\(\rightarrow\)next!=NULL
6) Set ptr = ptr\(\rightarrow\)next

    [END OF LOOP]
7) Set ptr\(\rightarrow\)next = new_node
8) Exit

Search

1) Initialise set ptr = start
2) Repeat step 3 while (ptr)!=NULL
3) If val = ptr\(\rightarrow\)data
   Set pos = ptr
   Gotostep 5
4) Set pos = NULL(-1)
5) Exit

Delete

1) Set ptr = Start
2) Set start = start \(\rightarrow\) next
3) Free ptr
4) exit
Program:

```c
#include<stdio.h>
#include<conio.h>
#include<stdlib.h>
struct node

}
Hence the program for implementing binary search tree traversal was successfully executed.
EXERCISE NO-9   GRAPH TRAVERSAL

**Aim**: To implement breadth first search (bfs) and depth first search (dfs) in graphs using adjacency matrix.

**Algorithm**:

**bfs(ints,int n)**

1) list L = empty
2) tree T = empty
3) choose a starting vertex x
4) search(x)
5) while(L nonempty)
6) remove edge (s,n) from start of L
7) if n not yet visited
   add (s,n) to T
   search(n)

**dfs(ints,int n)**

1) list L = empty
2) tree T = empty
3) choose a starting vertex x
4) search(x)
5) while(L nonempty)
6) remove edge (s,n) from end of L
7) if n not yet visited
   add (s,n) to T
   search(n)

**Program**:

```c
#include<stdio.h>
#include<conio.h>
int q[20],top=-1,front=-1,rear=-1,a[20][20],vis[20],stack[20];
int delete();
void add(int item);
void bfs(ints,int n);
void dfs(ints,int n);
void push(int item);
int pop();
void main()
{
 int n,i,s,ch,j;
 char c,dummy;
 clrscr();
 printf("n\n\tDFS and BFS implementation !");
 printf("n\nEnter the Number of Nodes in Graph: ");
```
```c
scanf("%d",&n);
for(i=1;i<=n;i++)
    { for(j=1;j<=n;j++)
        { printf("Enter 1 if %d has a NODE with %d else 0 ",i,j);
            scanf("%d",&a[i][j]);
        }
    }
printf("\n\n\tThe Adjecency Matrix is: ");
for(i=1;i<=n;i++)
    { for(j=1;j<=n;j++)
        { printf(" %d",a[i][j]);
        }
    }
printf("\n");
do
    { for(i=1;i<=n;i++)
        vis[i]=0;
    printf("\n\n\nMENU\n\n1) B.F.S (Breadth First Search)\n2) D.F.S (Depth First Search)\n\nEnter your choice: ");
    scanf("%d",&ch);
    printf("\nEnter source VERTEX: ");
    scanf("%d",&s);
    switch(ch)
    {
    case 1:bfs(s,n);
        break;
    case 2:dfs(s,n);
        break;
    } printf("\n\nWould you like to continue ?\n\nYes(Y) or No (N): ");
    scanf("%c",&dummy);
    scanf("%c",&c);
} while((c=='y')||(c=='Y'));
```
for(i=1;i<=n;i++)
    vis[i]=0;
bfs(i,n);
}
void add(int item)
{  if(rear==19)
    printf("QUEUE is FULL: Error No Space!");
    else
    {  if(rear==0)
        q[++rear]=item;

    int k;
    if(top==-1)
        return(0);
    else
        { k=stack[top--];
            return(k);
        }
}

**OUTPUT**:

```
1) B.F.S (Breadth First Search)
2) D.F.S (Depth First Search)

Enter your choice: 2
Enter source VERTEX: 1
  1 2 3
Would you like to continue?
   Yes(Y) or No (N): y

MENU
1) B.F.S (Breadth First Search)
2) D.F.S (Depth First Search)

Enter your choice: 1
Enter source VERTEX: 2
  2 3 1
Would you like to continue?
   Yes(Y) or No (N): y
```

**RESULT**:

Hence the program for implementing breadth first search (bfs) and depth first search (dfs) in graphs using adjacency matrix was successfully executed.
